

01-822

**IN THE SPECIFICATION**

Please replace the second full paragraph on page 4 of the specification with the following:

In various preferred embodiments of the invention, the viscous material is a liquid, such as glycerol or silicone oil, and may alternately be either electrically conductive or electrically non conductive. The viscosity of the viscous material is most preferably at least about five centipoise. In one embodiment, the viscous material is the electrically conductive solution, and in another embodiment the viscous material is mixed into the electrically conductive solution, either prior to or after the substrate is immersed in the electrically conductive solution. The viscous material may alternately be applied by dipping, swabbing, or spinning.
